

## Tipos de fallas controladas por la estructura del macizo rocoso - Falla Plana - Cuñas - Volcamiento - Rotación

## Equilibrio Límite

- Se debe asumir la superficie de falla
- La resistencia al corte se rige por algún criterio (ej. Mohr-Coulomb)
- Las deformaciones no son consideradas
- Normalmente sólo se satisface el equilibrio de fuerza
- Se utiliza un factor de seguridad que tiene como significado físico sólo que no se ha alcanzado la resistencia total del talud.
