

Crystals

- A crystal is a repeated array of atoms

- Crystal = Lattice + Basis

Crystal

Lattice of points
(Bravais Lattice)

Basis of atoms

Physics 389 F 2000 Lect 2

2

Classification of Crystal Structures

- Crystal structures classified by:
- Translation symmetry
 - Only the **Bravais** lattice
 - Limited number of possible crystal translation **types**
- Rotation, Inversion, reflection symmetry
 - Depends upon basis
 - Limited number of possible crystal **types**
- Examples in 2 dimensions, 3 dimensions
- See Kittel for lists of possible translation types, other crystallography references for all possible crystal types

Physics 389 F 2000 Lect 2

3

Two Dimensional Crystals

- Infinite number of possible crystals
- Finite number of possible crystal types

Physics 389 F 2000 Lect 2

4

Lattices and Translations

- The entire infinite lattice is specified by the primitive vectors a_1 and a_2 (also a_3 in 3-d)
- $T(n_1, n_2, \dots) = n_1 a_1 + n_2 a_2$ (+ $n_3 a_3$ in 3-d), where the n 's are integers

Physics 389 F 2000 Lect 2

5

Possible Two Dimensional Lattices

- Special angles $\phi = 90$ and 60 degrees lead to special crystal types
- In addition to translations, the lattice is invariant under rotations and/or reflections

Physics 389 F 2000 Lect 2

6

Possible Two Dimensional Lattices

General oblique

Hexagonal $\Phi = 60$, $a_1 = a_2$
6-fold rotation, reflections

Square
4-fold rot., reflect.

Rectangular
2-fold rot., reflect.

Centered Rectangular
2-fold rot., reflect.

- These are the **only** possible special crystal types in two dimensions

Physics 389 F 2000 Lect 2

7

Close packing of spheres in a 2-d crystal

- Each sphere has 6 equal neighbors
- Close packing for spheres
- Hexagonal symmetry (rotation by 60 degrees)

Physics 389 F 2000 Lect 2

8

More on Two Dimensional Lattices

- Why cannot there be a five-fold rotation in a crystal lattice?
- Why is the centered square not a special type?

Physics 389 F 2000 Lect 2

9

Crystalline layers with >1 atom basis

CuO_2 Square Lattice

Honeycomb Lattice
(Graphite or BN layer)

- Left - layers in the High T_c superconductors
- Right - single layer of carbon graphite or hexagonal BN (the two atoms are chemically different in BN, not in C)

Physics 389 F 2000 Lect 2

10

Two Dimensional Lattices Primitive Cell and Wigner-Seitz Cell

One possible Primitive Cell

Wigner-Seitz Cell -- Unique

- All primitive cells have same area (volume)
- Wigner Seitz Cell is most compact, highest symmetry cell possible
- Also same rules in 3 dimensions

Physics 389 F 2000 Lect 2

11

Three Dimensional Lattices Simplest examples

Simple Orthorhombic Bravais Lattice

Hexagonal Bravais Lattice

- **Orthorhombic:** angles 90 degrees, 3 lengths different
- **Tetragonal:** 2 lengths same; **Cubic:** 3 lengths same
- **Hexagonal:** a_3 different from a_1, a_2 by symmetry

Physics 389 F 2000 Lect 3

5

Face Centered Cubic Two views - Conventional Cubic Cell

Conventional Cell of Face Centered Cubic Lattice
4 times the volume of a primitive cell

Physics 389 F 2000 Lect 3

6

One Primitive Cell

Wigner-Seitz Cell

Face Centered Cubic Lattice

Body Centered Cubic Lattice

Wigner-Seitz Cell for
Body Centered Cubic Lattice

Conventional Cell Face Centered and Body Centered

Conventional Cells

BCC: atoms at (000) , $(1/2, 1/2, 1/2)$

FCC: atoms at (000) , $(0, 1/2, 1/2)$, $(1/2, 0, 1/2)$, $(1/2, 1/2, 0)$

Physics 389 F 2000 Lect 3

9

Lattice Planes - Index System

Plane through the lattice $n_1 a_1$, $n_2 a_2$, $n_3 a_3$
 n 's can be integers or rational fractions

- Define the plane by the reciprocals $1/n_1$, $1/n_2$, $1/n_3$
- Reduce to three integers with same ratio h, k, l
- Plane is defined by h, k, l

Physics 389 F 2000 Lect 3

10

Schematic illustrations of lattice planes Lines in 2d crystals

- Infinite number of possible planes
- Can be through lattice points or between lattice points

Physics 389 F 2000 Lect 3

11

Schematic illustrations of lattice planes Lines in 2d crystals

- Equivalent parallel planes
- Low index planes: more dense, more widely spaced
- High index planes: less dense, more closely spaced

Physics 389 F 2000 Lect 3

12

Schematic illustrations of lattice planes Lines in 2d crystals

- Planes “slice through” the basis of physical atoms

Lattice planes in cubic crystals

(100) and (110) planes in a cubic lattice
(illustrated for the fcc lattice)

(111) lattice planes in cubic crystals

Face Centered Cubic Lattice

Lattice planes perpendicular to $[111]$ direction

Each plane is hexagonal close packed array of points

Physics 389 F 2000 Lect 3

15

Stacking hexagonal 2d layers to make close packed 3-d crystal

- Each sphere has 12 equal neighbors
- 6 in plane, 3 above, 3 below
- Close packing for spheres
- Can stack each layer in one of two ways, B or C above A
- Also see figure in Kittel

Physics 389 F 2000 Lect 3

16

Stacking hexagonal 2d layers to make hexagonal close packed (hcp) 3-d crystal

- Each sphere has 12 equal neighbors
- Close packing for spheres
- See figure in Kittel for stacking sequence
- HCP is ABABAB..... Stacking
- Basis of 2 atoms

Physics 389 F 2000 Lect 3

Hexagonal close packed

Hexagonal Bravais Lattice
Two atoms per cell

Physics 389 F 2000 Lect 3

18

Stacking hexagonal 2d layers to make cubic close packed (ccp) 3-d crystal

- Each sphere has 12 equal neighbors
- Close packing for spheres
- See figure in Kittel for stacking sequence
- CCP is ABCABCABC..... Stacking
- Basis of 1 atom

Physics 389 F 2000 Lect 3

Other polytype

- Infinite number of ways to stack planes
- Polytypes occur in some metals, materials like SiC

Physics 389 F 2000 Lect 3

20

Cubic crystals with a basis

NaCl Structure with
Face Centered Cubic Bravais Lattice

ZnS Structure with
Face Centered Cubic Bravais Lattice
C, Si, Ge form diamond structure with
only one type of atom

Physics 389 F 2000 Lect 3

21

Atomic planes in NaCl and ZnS crystals

(110) planes in NaCl crystal
rows of the Na and Cl atoms

(110) plane in ZnS crystal
zig-zag Zn-S chains of atoms

Physics 389 F 2000 Lect 3

24

(110) plane in diamond structure crystal

(100) plane in ZnS crystal
zig-zag Zn-S chains of atoms
(diamond if the two atoms are the same)

Calculated valence electron density
in a (110) plane in a Si crystal
(Cover of Physics Today, 1970)

Physics 389 F 2000 Lect 3

25

(111) planes in ZnS crystals

C _____
B _____
A _____
C _____
B _____
A _____
CCP

(111) plane in cubic ZnS crystal
unequal spaced planes of Zn and S atoms

ABAB... stacking gives hexagonal ZnS crystal

Physics 389 F 2000 Lect 3

26

Perovskite Structure ABO_3 , e.g. $BaTiO_3$

Simple Cubic Bravais Lattice

A atoms have 12 O neighbors
B atoms have 6 closer O neighbors

Physics 389 F 2000 Lect 3

27

Symmetries of crystals in 3 dimensions

- All Crystals can be classified by:
- 7 Crystal systems (triclinic, monoclinic, orthorhombic, tetragonal, cubic, hexagonal, trigonal)
- 14 Bravais Lattices (primitive, face-centered or body-centered for each of the 7 systems)
- 32 Points groups (rotations, inversion, reflection)
- See references in Kittel Ch 1, G. Burns, "Solid State Physics"

Physics 389 F 2000 Lect 3

28
