

OpenGL 3.2 API Quick Reference Card

OpenGL® is the only cross-platform graphics API that enables developers of software for PC, workstation, and supercomputing hardware to create high-performance, visually-compelling graphics software applications, in markets such as CAD, content creation, energy, entertainment, game development, manufacturing, medical, and virtual reality.

- *see FunctionName* refers to functions on this reference card.
- [n.n.n] and [Table n.n] refer to sections and tables in the OpenGL 3.2 core specification.
- [n.n.n] refers to sections in the OpenGL Shading Language 1.50 specification.
- Content shown in blue is removed from the OpenGL 3.2 core profile and present only in the OpenGL 3.2 compatibility profile. Profile selection is made at context creation.
- [n.n.n] and [Table n.n] refer to sections and tables in the OpenGL 3.2 compatibility profile specification, and are shown only when they differ from the core profile.

Specifications are available at www.opengl.org/registry

The arguments enclosed in brackets ([args ,] and [, args]) may or may not be present.

The argument type T and the number N of arguments may be indicated by the command name suffixes. N is 1, 2, 3, or 4 if present, or else corresponds to the type letters from the Command Table (above). If "v" is present, an array of N items are passed by a pointer.

For brevity, the OpenGL documentation and this reference may omit the standard prefixes. The actual names are of the forms: glFunctionName(), GL_CONSTANT, GLtype

Preprocessor [3.3]

Preprocessor Operators

Preprocessor operators follow C++ standards. Preprocessor expressions are evaluated according to the behavior of the host processor, not the processor targeted by the shader.

`#version 150`
`#version 150 compatibility`

"#version 150" is required in shaders using version 1.50 of the language. #version must occur in a shader before anything else other than white space or comments. Use "compatibility" to access features in the compatibility profile.

`#extension extension_name : behavior`
`#extension all : behavior`

- `behavior`: require, enable, warn, disable
- `extension_name`: the extension supported by the compiler, or "all"

Predefined Macros

<code>_LINE_</code>	<code>_FILE_</code>	Decimal integer constants	<code>_VERSION_</code>	Decimal integer, e.g.: 150
---------------------	---------------------	---------------------------	------------------------	----------------------------

Qualifiers

Storage Qualifiers [4.3]

Variable declarations may have one storage qualifier.

<code>none</code>	(default) local read/write memory, or input parameter
<code>const</code>	compile-time constant, or read-only function parameter
<code>in</code>	linkage into a shader from previous stage (copied in) linkage with centroid based interpolation
<code>out</code>	linkage out of a shader to subsequent stage (copied out) linkage with centroid based interpolation
<code>uniform</code>	linkage between a shader, OpenGL, and the application

Uniform [4.3.5]

Use to declare global variables with the same values across the entire primitive being processed. Uniform variables are read-only. Use uniform qualifiers with any basic data types or array of these, or when declaring a variable whose type is a structure, e.g.:

`uniform vec4 lightPosition;`

Layout Qualifiers [4.3.8]

`layout(layout-qualifiers) block-declaration`
`layout(layout-qualifiers) in/out/uniform`
`layout(layout-qualifiers) in/out/uniform declaration`

Input Layout Qualifiers

Layout qualifier identifiers for geometry shader inputs:
points, lines, lines_adjacency, triangles, triangles_adjacency

Fragment shaders can have an input layout only for redeclaring the built-in variable `gl_FragCoord` with the layout qualifier identifiers:

`origin_upper_left, pixel_center_integer`

Output Layout Qualifiers

Layout qualifier identifiers for geometry shader outputs:
points, line_strip, triangle_strip,
`max_vertices = integer-constant`

Uniform-Block Layout Qualifiers

Layout qualifier identifiers for uniform blocks:
shared, packed, std140, row_major, column_major

Preprocessor Directives

Each number sign (#) can be preceded in its line only by spaces or horizontal tabs.

<code>#</code>	<code>#define</code>	<code>#undef</code>	<code>#if</code>	<code>#ifdef</code>
<code>#ifndef</code>	<code>#else</code>	<code>#elif</code>	<code>#endif</code>	<code>#error</code>
<code>#pragma</code>	<code>#extension</code>	<code>#version</code>	<code>#line</code>	

Interpolation Qualifier [4.3.9]

Qualify outputs from vertex shader and inputs to fragment shader.

<code>smooth</code>	perspective correct interpolation
<code>flat</code>	no interpolation
<code>noperspective</code>	linear interpolation

The following predeclared variables can be redeclared with an interpolation qualifier:

Vertex language:	<code>gl_FrontColor</code> <code>gl_BackColor</code> <code>gl_FrontSecondaryColor</code> <code>gl_BackSecondaryColor</code>
------------------	--

Fragment language:	<code>gl_Color</code> <code>gl_SecondaryColor</code>
--------------------	---

Parameter Qualifiers [4.4]

Input values are copied in at function call time, output values are copied out at function return time.

<code>none</code>	(default) same as in
<code>in</code>	for function parameters passed into a function
<code>out</code>	for function parameters passed back out of a function, but not initialized for use when passed in
<code>inout</code>	for function parameters passed both into and out of a function

Precision and Precision Qualifiers [4.5]

Precision qualifiers have no effect on precision; they aid code portability with OpenGL ES. They are:

`highp, mediump, lowp`

Precision qualifiers precede a floating point or integer declaration: `lowp float color;`

A precision statement sets a default for subsequent declarations: `highp int;`

Invariant Qualifiers Examples [4.6]

<code>#pragma STDGL invariant(all)</code>	force all output variables to be invariant
<code>invariant gl_Position;</code>	qualify a previously declared variable
<code>invariant centroid out vec3 Color;</code>	qualify as part of a variable declaration

Order of Qualification [4.7]

When multiple qualifications are present, they must follow a strict order. This order is as follows.

`invariant, interpolation, storage, precision`
`storage, parameter, precision`

14.	<code> </code>	logical inclusive or
15.	<code>? :</code>	selection (Selects one entire operand. Use <code>mix()</code> to select individual components of vectors.)
	<code>=</code>	
	<code>+=</code>	
16.	<code>* /=</code>	assignment
	<code>%= << >>=</code>	arithmetic assignments
	<code>&= ^= =</code>	
17.	<code>,</code>	sequence

Vector Components [5.5]		
In addition to array numeric subscript syntax (e.g., <code>v[0], v[i]</code>), names of vector components are denoted by a single letter. Components can be swizzled and replicated, e.g.: <code>pos.xx, pos.zy</code>		
<code>{x, y, z, w}</code>	Use when accessing vectors that represent points or normals	
<code>{r, g, b, a}</code>	Use when accessing vectors that represent colors	
<code>{s, t, p, q}</code>	Use when accessing vectors that represent texture coordinates

 $v = v * v;$ // vector * vector component-wise
 $m = m * op m;$ // matrix op matrix component-wise
 $m = m * v;$ // linear algebraic multiply
