

# Introduction to Quality Management and Statistical Process Control

I

Prof. Marcelo Olivares

## Outline for Quality Management Module

- ▶ Introduction
- ▶ **Quality Control**
  - ▶ Inspection vs. process control
  - ▶ Common Causes, Special Causes
  - ▶ Control Charts
- ▶ **Process Capability**
  - ▶ Performance limits, Specification limits
  - ▶ Capability index, Six-Sigma.

## J.D. Power and Associates 2010 Initial Quality Study™ (IQS)

**2010 Nameplate IQS Ranking**  
Problems per 100 Vehicles

▶ 4

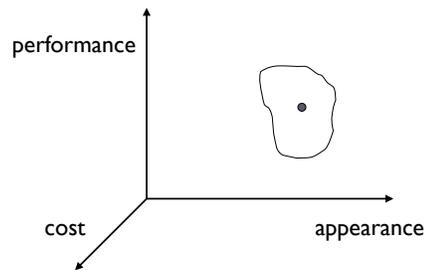

Source: J.D. Power and Associates 2010 Initial Quality Study™

Prof. Marcelo Olivares

## Quality: Strategic and Operational issues

- ▶ Quality of design
  - ▶ product positioning (strategic)
- ▶ Quality of conformance
  - ▶ minimizing deviations from the target (operational)

JD Power Initial Quality Study:  
*"The study captures problems experienced by owners in two distinct categories— quality of design and defects and malfunctions".*

▶ 5

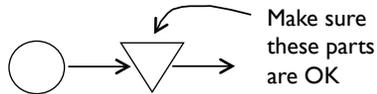

Prof. Marcelo Olivares

## Quality Management: Statistical Process Control

6

Prof. Marcelo Olivares

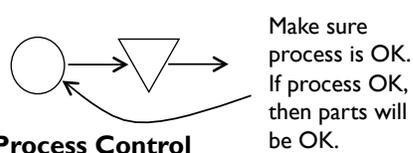

## Quality Control

### Inspection

- ▶ Objective: Sort out bad product before it reaches your customers.
- ▶ Procedure:
  - ▶ Detect deviations from quality standards
  - ▶ Reject/accept output

Detection

### Process Control

- ▶ Objective: Control the quality of product by controlling/improving the process.
- ▶ Procedure:
  - ▶ Track quality metrics.
  - ▶ Determine if process is stable.
  - ▶ Find root causes and improve continuously.

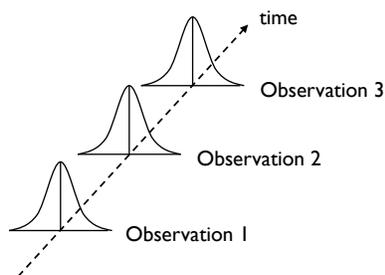

Prevention

▶ 7

Prof. Marcelo Olivares

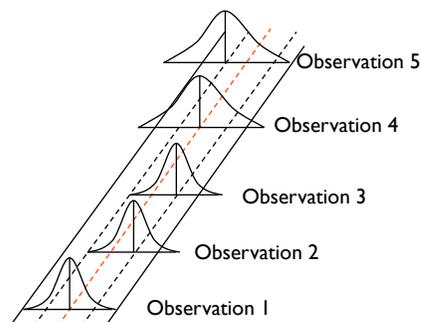

## Different sources of variability

### ▶ Process in-control

- ▶ Pattern is predictable.
- ▶ Subject to *Common Causes* of variability

### ▶ Process out-of-control

- ▶ Pattern changes over time.
- ▶ Subject to *Special Causes* of variability.

▶ 8

Prof. Marcelo Olivares

## Why do we care if it is Common or Special causes?

### Common causes

- Natural variation given by the design of the process
- Cannot be traced to a single factor (background noise)
- To reduce it, process needs to be changed.
- Examples
  - product design
  - work method

### Special causes

- External forces which can sometimes be traced to specific factors.
- Can be corrected without fundamentally changing the process.
- Examples
  - design changes
  - Production start-up

Different actions need to be taken to improve quality depending on whether the process is in or out of control.

▶ 9

Prof. Marcelo Olivares

## Monitoring Processes: Control Charts

- Objective:
  - Use data to determine if the process is in-control.
  - Detect variability due to *special causes*.
- Tool: Control Charts
- Attribute characteristics:
  - good or bad, defective or not, etc.
- Measurable characteristics:
  - size, weight, strength, time, etc.

→ P-chart

→ X-bar chart, R chart

▶ 10

Prof. Marcelo Olivares

## Application: Customer Service in Retail

11

Prof. Marcelo Olivares

## Construction of P-Chart

- Take  $m$  samples (e.g.,  $m=100$ )
- The  $i^{\text{th}}$  sample contains  $n_i$  units,  $i=1, \dots, m$
- $D_i$  = number of defective units in the  $i^{\text{th}}$  sample
- Plot  $D_i/n_i$ ,  $i=1, \dots, m$
- Calculate:

$$\bar{p} = \frac{\text{total number of defects}}{\text{total number of observations}}$$

} Our best prediction of the probability of failure.

$$UCL_i = \bar{p} + 3\sqrt{\frac{\bar{p}(1-\bar{p})}{n_i}}$$

Upper Control Limit

$$\text{center line} = \bar{p}$$

$$LCL_i = \bar{p} - 3\sqrt{\frac{\bar{p}(1-\bar{p})}{n_i}}$$

Lower Control Limit

Falling outside control limits could be due to:

1. A rare event (3/1000) if process is in-control.
2. Process is out-of-control.

Assume process is out-of-control.

▶ 12

Prof. Marcelo Olivares

## Application: Sales Engagement

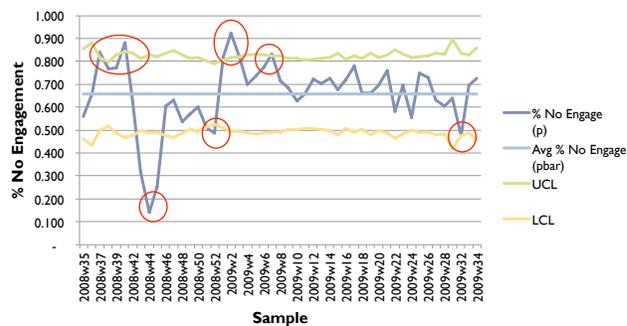

▶ 13

Prof. Marcelo Olivares

## Application to Customer Engagement Data

- ▶ Defects: customer is not engaged by sales associate.
- ▶ Select sample:
  - ▶ One store, optics area, group data by week.
  - ▶ Total of 52 weeks.

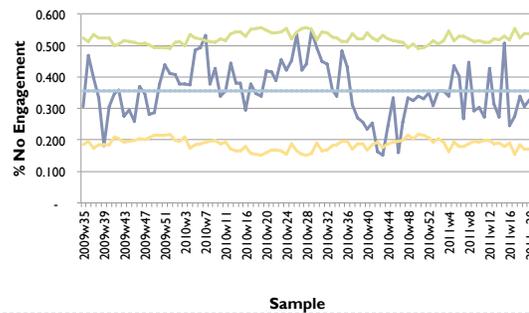

▶ 14

Prof. Marcelo Olivares

## What did this retailer do?

- ▶ Weekly reports to store manager providing feedback on engagement performance.
- ▶ Financial incentives to store managers based on reports.
- ▶ Group discussions with sales associates to identify problems and solutions.

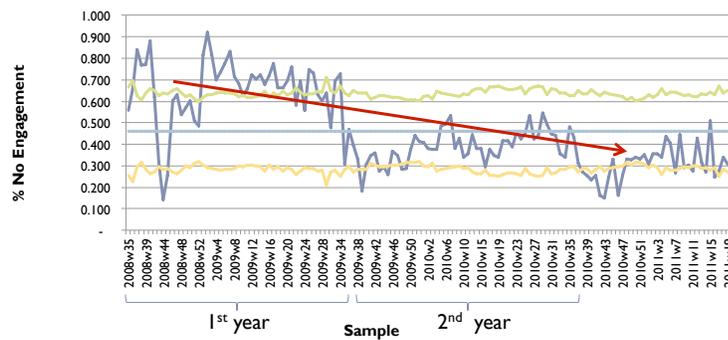

One year later...

▶ 15

Prof. Marcelo Olivares

## What if we pool all the data in one P-chart?

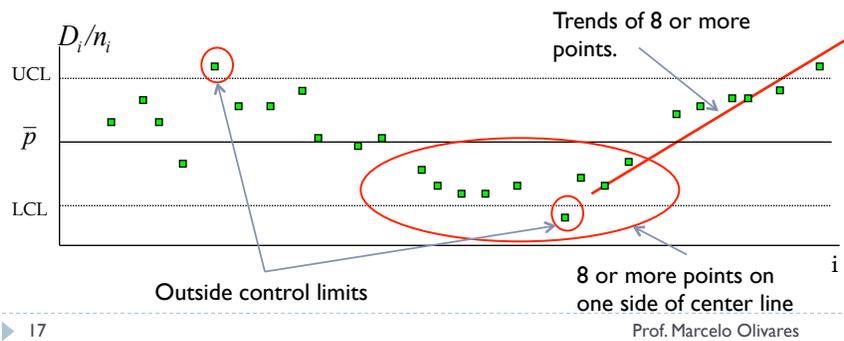

- In one year, engagement rate dropped from 65% to 34%.

▶ 16

Prof. Marcelo Olivares

## Using Control Charts

- ▶ **Objective:** diagnose the state of the process (in or out of control).
- ▶ **Diagnosis:** look at observations or patterns which would be unlikely to be generated by an in-control process (e.g. 3/1000).

## Choosing Sample groups

- ▶ Sample is chosen so that variation *between* and *within* samples capture different sources of variability.

Source of Variability	Type of variation in Control Charts
Common Causes	- <i>Within sample</i> variation.
Special Causes	- <i>Between sample</i> variation. -Captured by differences <i>across</i> groups.

- ▶ **Sample size:**
  - ▶ Variation within smaller samples is more likely to reflect pure common-cause variation.
  - ▶ Larger samples size makes it easier to detect when process is out-of-control (i.e. reduces the chances of mistakenly concluding the process is in-control when it is truly out-of-control).

▶ 18

Prof. Marcelo Olivares

## Control Chart for Measurable Characteristics: X-bar chart

19

Prof. Marcelo Olivares

## Construction of X-bar Chart

1) Take samples of data. Let  $n_j$  be the sample size of sample  $j$ .

$$(X_{11} X_{12} \cdots X_{1n_1}) \cdots (X_{j1} X_{j2} \cdots X_{jn_j}) \cdots (X_{m1} X_{m2} \cdots X_{mn_m})$$

sample 1                      sample j                      sample m

2) Compute mean and standard deviation for each sample.

$$\bar{X}_j = \frac{X_{j1} + X_{j2} + \cdots + X_{jn_j}}{n_j} \quad (\text{sample mean})$$

$$S_j^2 = \frac{(X_{j1} - \bar{X}_j)^2 + (X_{j2} - \bar{X}_j)^2 + \cdots + (X_{jn_j} - \bar{X}_j)^2}{n_j - 1} \quad (\text{sample variance})$$

$$S_j = \sqrt{S_j^2} \quad (\text{sample std. dev.})$$

▶ 20

Prof. Marcelo Olivares

3) Compute

$$\bar{\bar{X}} = \frac{\bar{X}_1 + \bar{X}_2 + \dots + \bar{X}_m}{m} \quad (\text{Overall average})$$

$$\bar{S} = \frac{S_1 + S_2 + \dots + S_m}{m} \quad (\text{Average sample std. dev.})$$

4) Estimate the process mean and standard deviation (when it is in-control).

$\mu = E[X]$	$\hat{\mu} = \bar{\bar{X}}$
$\sigma = \text{std}[X]$	$\hat{\sigma} = \bar{S}$
└──────────┘	└──────────┘
unknowns	estimates

**5) Draw X-bar Chart:** tracks the **mean** of the process output.

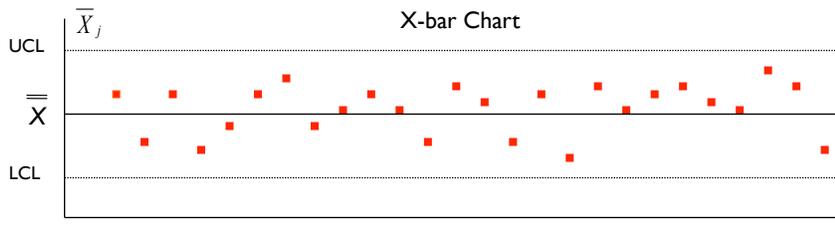

Plot  $\bar{X}_j, j = 1, \dots, m$  with

$$\text{UCL} = \bar{\bar{X}} + \frac{3\bar{R}}{d_2\sqrt{n}}$$

$$\text{Center Line} = \bar{\bar{X}}$$

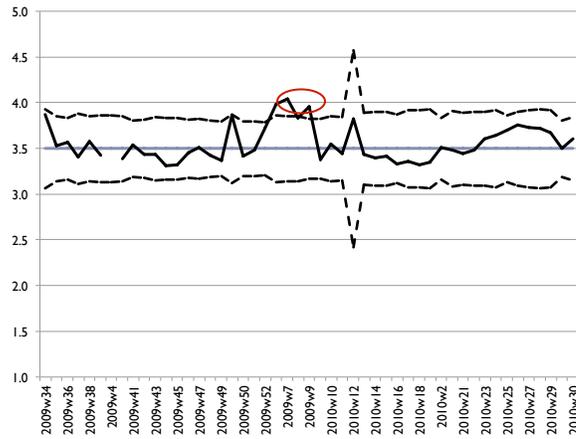

$$\text{LCL} = \bar{\bar{X}} - \frac{3\bar{R}}{d_2\sqrt{n}}$$

Falling outside control limits is a rare event when the process is in-control.  
=> We assume the process is out-of-control.

## Customer Service Example

X-bar chart for the logarithm of engagement time.

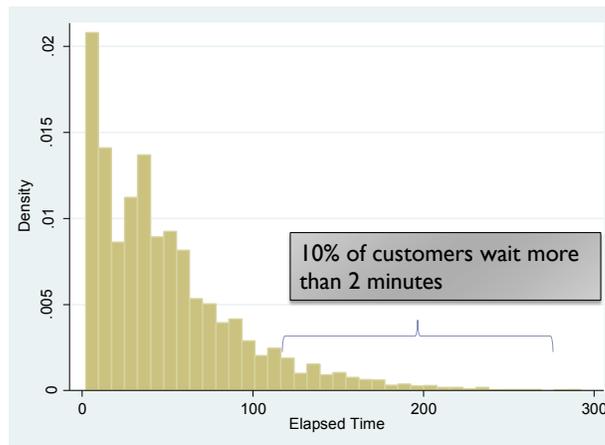

▶ 23

Prof. Marcelo Olivares

## It is in-control, but is it a “good” process?

Histogram of engagement time

▶ 24

Prof. Marcelo Olivares

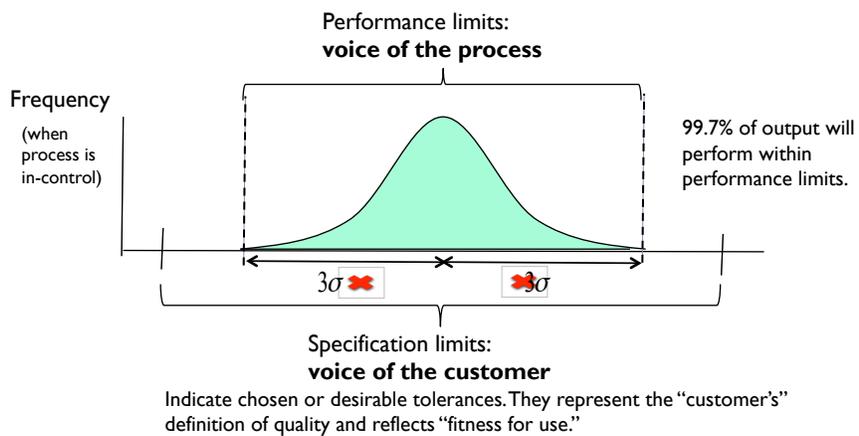

## Quality Management: Process Capability

25

Prof. Marcelo Olivares

### What about the customer?

- ▶ If the process is in control, then it will produce *statistically predictable* outputs.

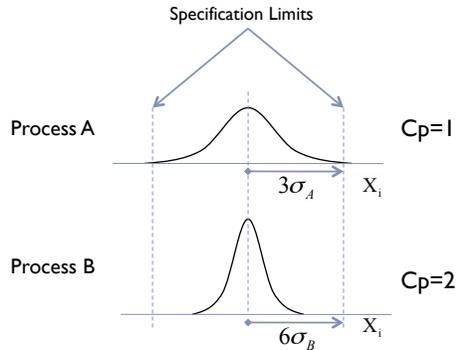

▶ 26

Prof. Marcelo Olivares

## Process Capability Index (Cp)

$$C_p = \frac{\text{allowable process spread}}{\text{actual process spread}} = \frac{\text{upper spec limit} - \text{lower spec limit}}{6\sigma}$$

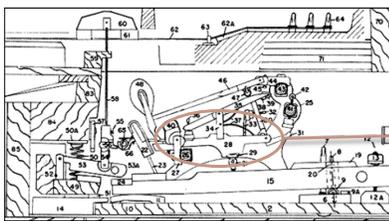

- Capable:  $C_p = 1$
- Some companies set as target:  
 $C_p = 1.33$
- Motorola's **Six Sigma Quality**:  
 $C_p = 2$

▶ 27

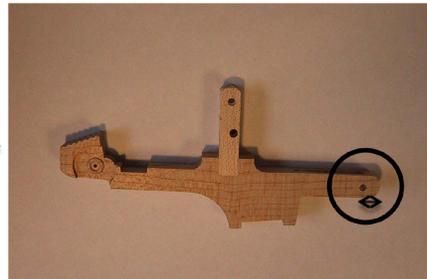

Prof. Marcelo Olivares

## Example – Steinway Piano Action Mechanism

Each piano key has an *action mechanism*.  
Each action contains 58 parts.

Adapted from the case "Technology and Quality at Steinway & Sons", E. Johnson, J. Hall and D. Pyke, Tuck School of Business, Dartmouth.

**Part #28**

- Hole drilled through slotted shaft.
- Pin slides through hole to attach to other pieces.

**Engineering specifications:**  
*0.200 inches from the end of shaft, plus or minus 0.015 inches.*

Specification Limits

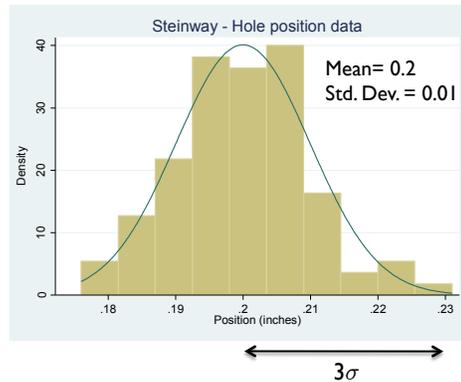

▶ 28

Prof. Marcelo Olivares

## ...Example

100 items measured

Item #	Distance
1	0.208
2	0.200
...	...
99	0.202
100	0.197

$$C_p = \frac{2 \times 0.015}{6 \times 0.01} = 0.5$$

▶ 29

Prof. Marcelo Olivares

## SPC- Takeaways

- ▶ Monitor the *process* to prevent defective output.
- ▶ Consistency in output = Process is in-control.
  - ▶ Measure common causes of variability.
  - ▶ Tools to detect special causes of variability.
  - ▶ Eliminate special causes by finding its root cause.
- ▶ In control process is not the same as high quality.
  - ▶ Specification limits are determined by the customer.
  - ▶ Process capability: ability of process to meet customer specifications.
  - ▶ Reduce variation caused by common causes to ensure output is within specifications.

▶ 30

Prof. Marcelo Olivares

## Next Class...

---

- ▶ **Preparation for Ritz Carlton case:**
  - ▶ Work with your group.
  - ▶ Download data on Angel.
  - ▶ Focus on one defect category.
  - ▶ Think carefully on how you choose samples.
  - ▶ Read case preparation questions and bring case write-up to class.
