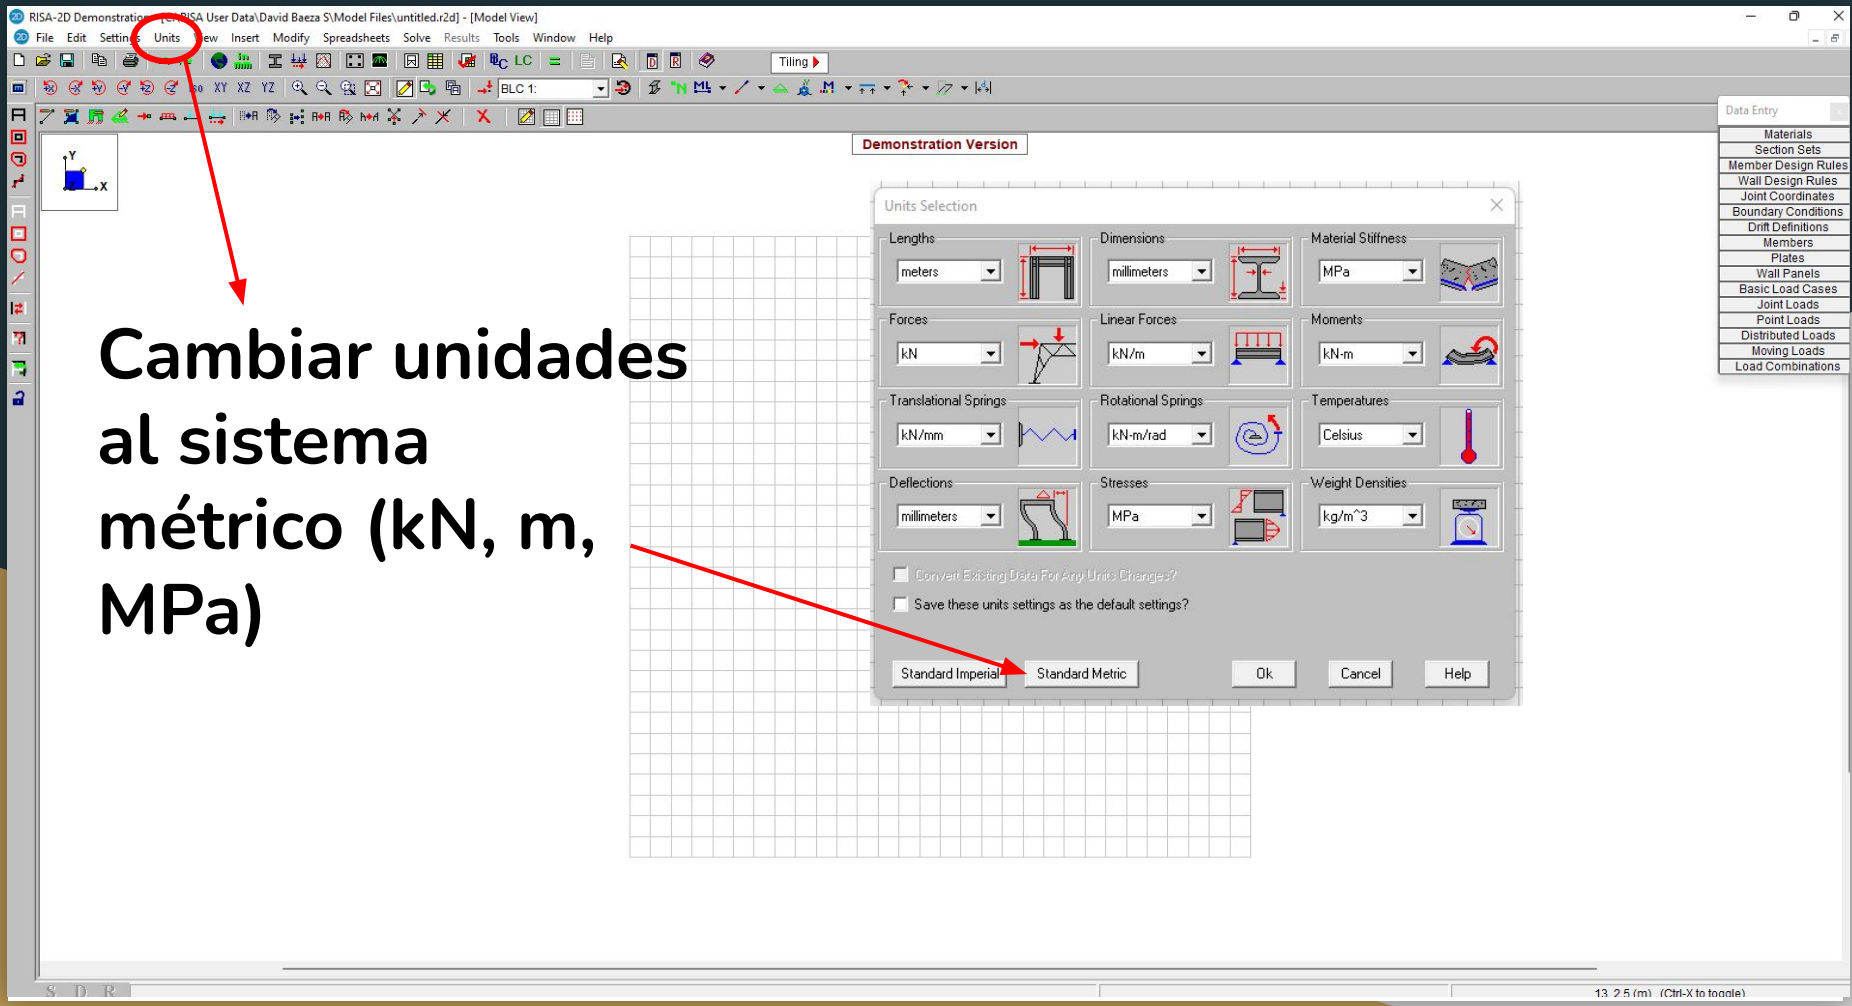
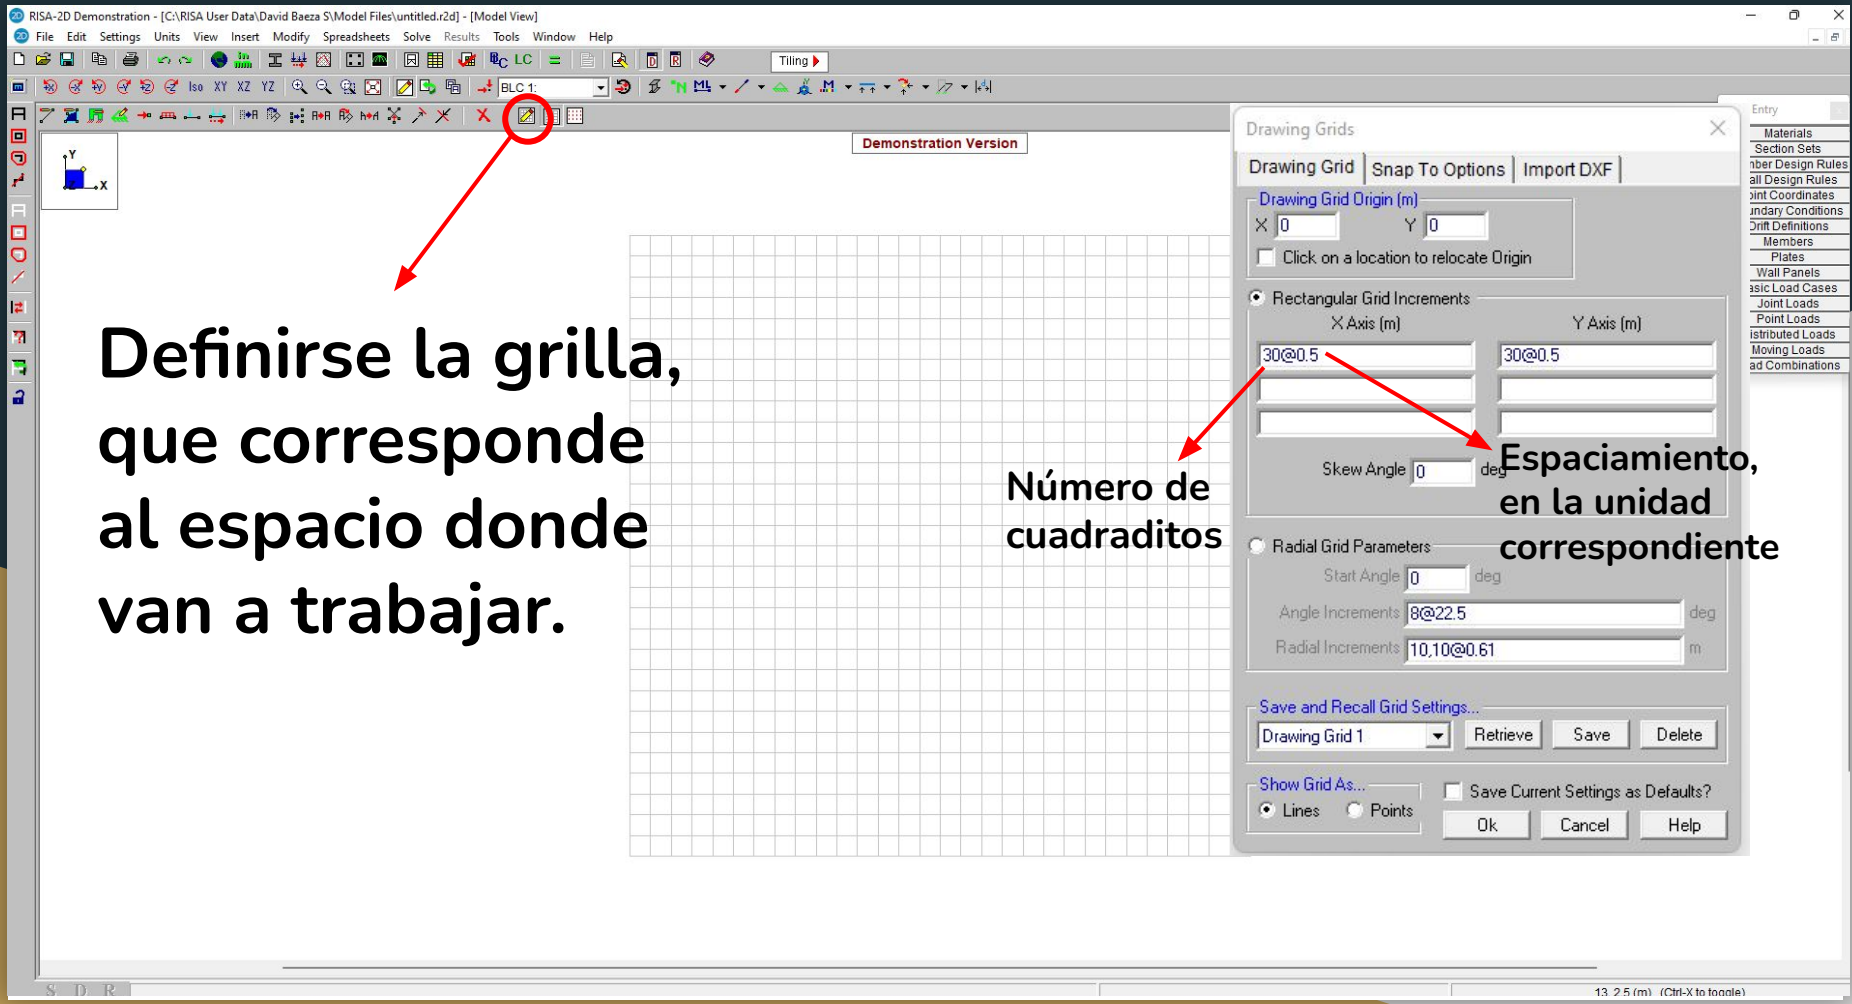
¿Cómo usar RISA-2D?

Cambiar unidades al sistema métrico (kN, m, MPa)





Definirse la grilla, que corresponde al espacio donde van a trabajar.
Número de cuadraditos
Espaciamiento, en la unidad correspondiente

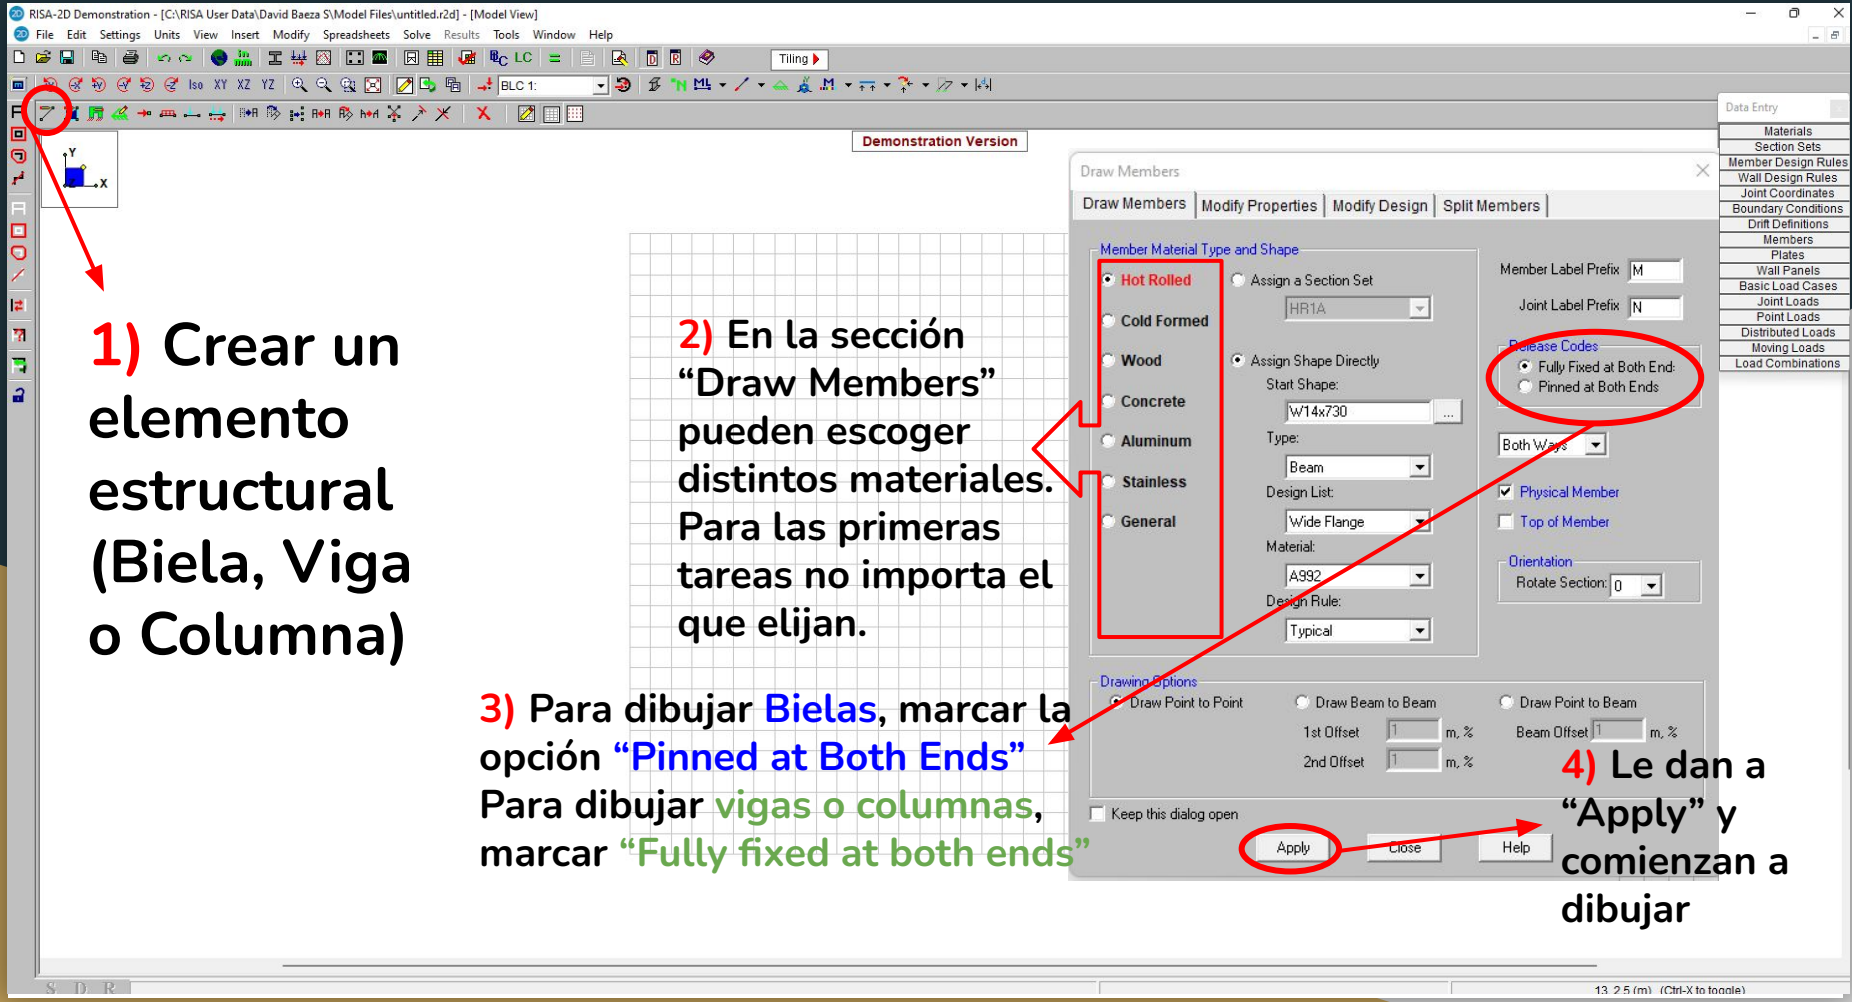
Help
Demonstration Version



1) Crear un elemento estructural (Biela, Viga o Columna)
2) En la sección "Draw Members" pueden escoger distintos materiales. Para las primeras tareas no importa el que elijan.
3) Para dibujar Bielas, marcar la opción "Pinned at Both Ends"
Para dibujar vigas o columnas, marcar "Fully fixed at both ends"
4) Le dan a "Apply" y comienzan a dibujar

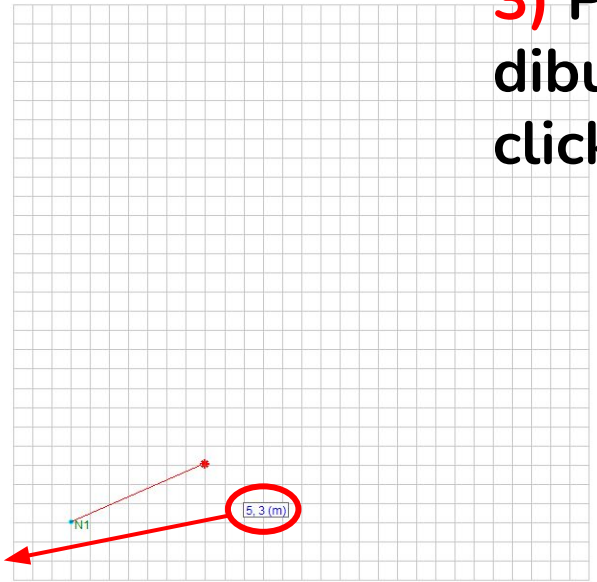
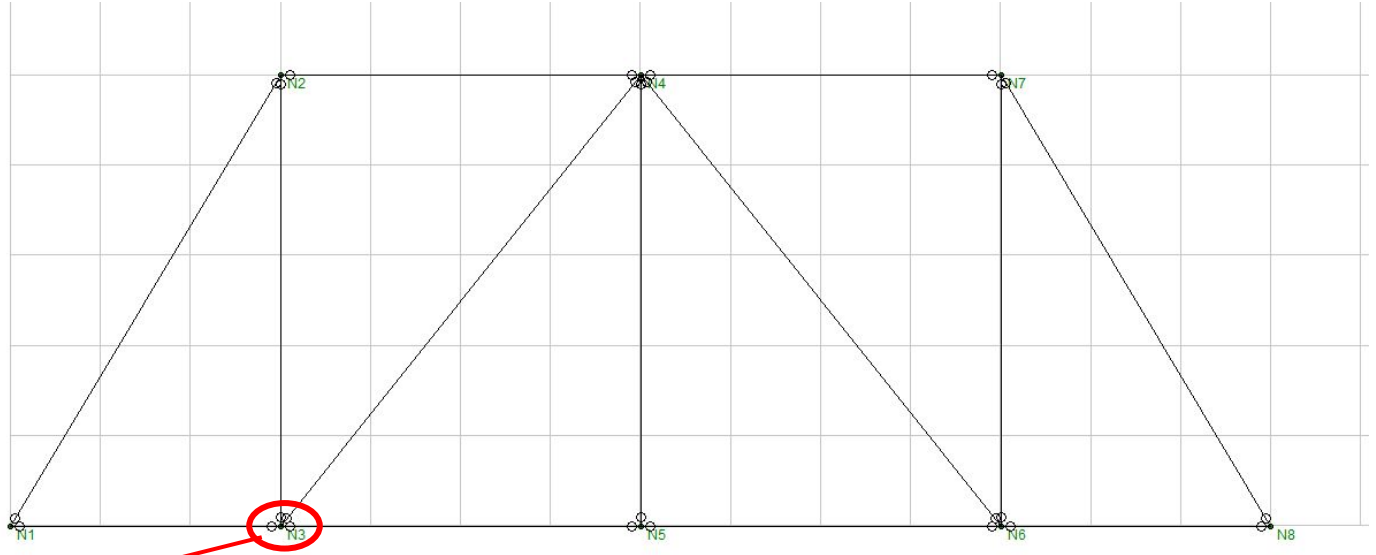
Help

1) Al dibujar, con click izquierdo van marcando los puntos que separe a las secciones

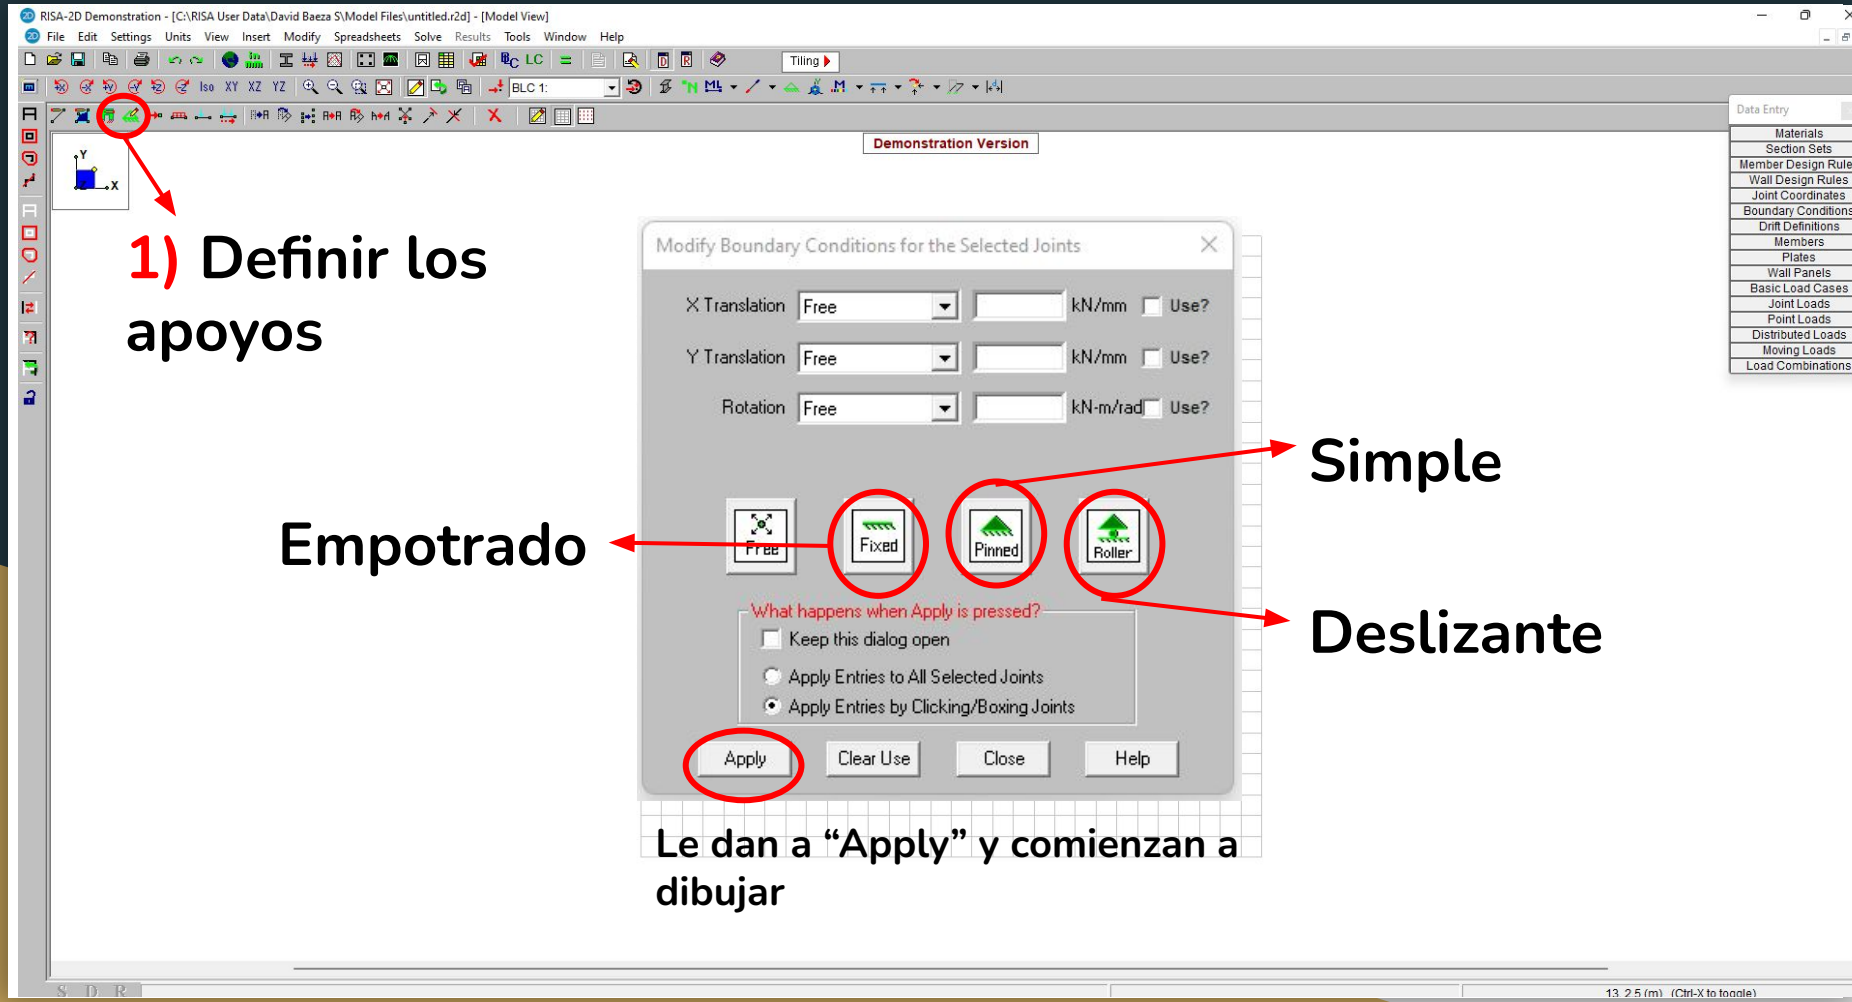
2) Al pararse en cualquier zona de la grilla, les indicará la posición x,y



3) Pueden “soltar” el dibujo apretando el click derecho.



Al dibujar bielas, fijarse que aparezcan estos círculos en todos los extremos



1) Definir los apoyos
Modify Boundary Conditions for the Selected Joints

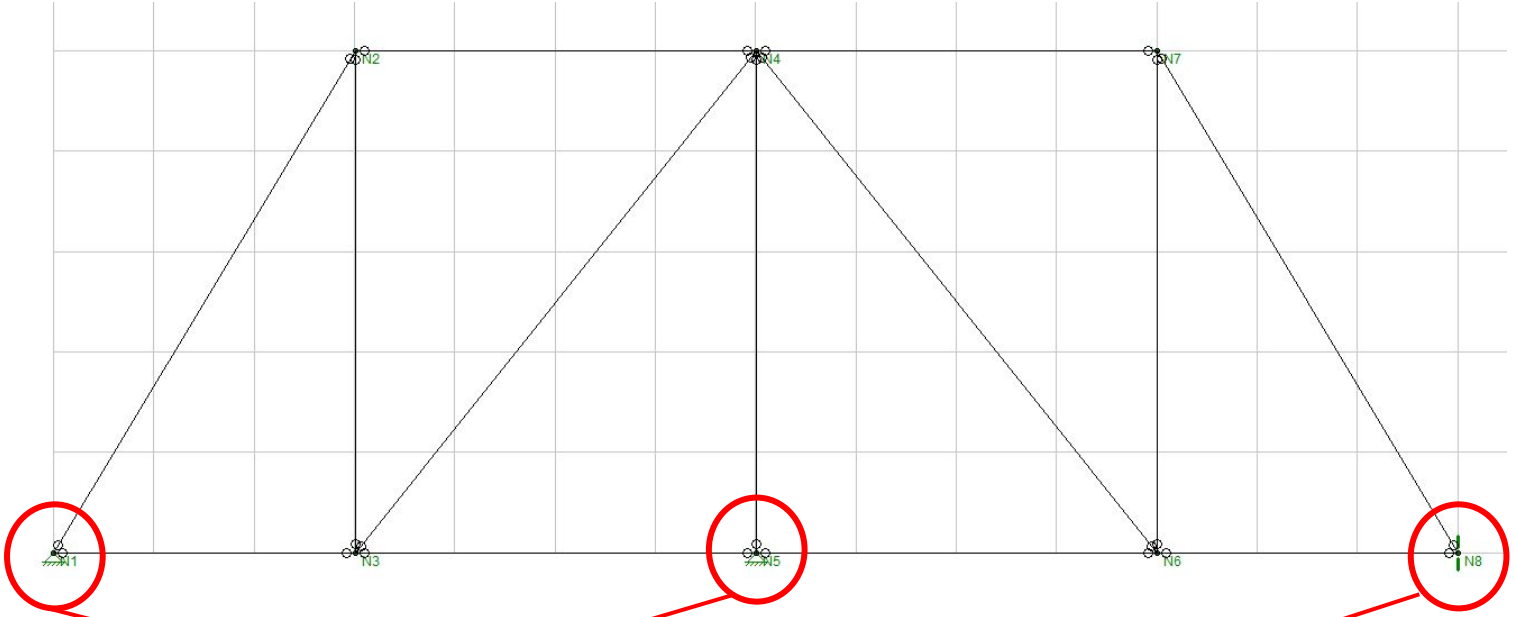
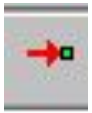
Simple
Deslizante
Le dan a “Apply” y comienzan a dibujar



Apoyo Simple

Apoyo Deslizante

1) Definir las cargas

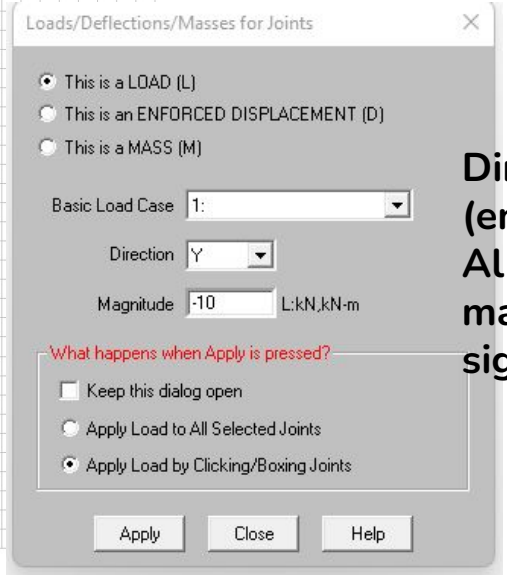


Carga puntual en un nodo

Carga distribuida

Carga puntual en cualquier parte de la sección

Carga puntual, pero con opción de moverse



Dirección X o Y (en mayúscula)
Al definir la magnitud, usar el signo

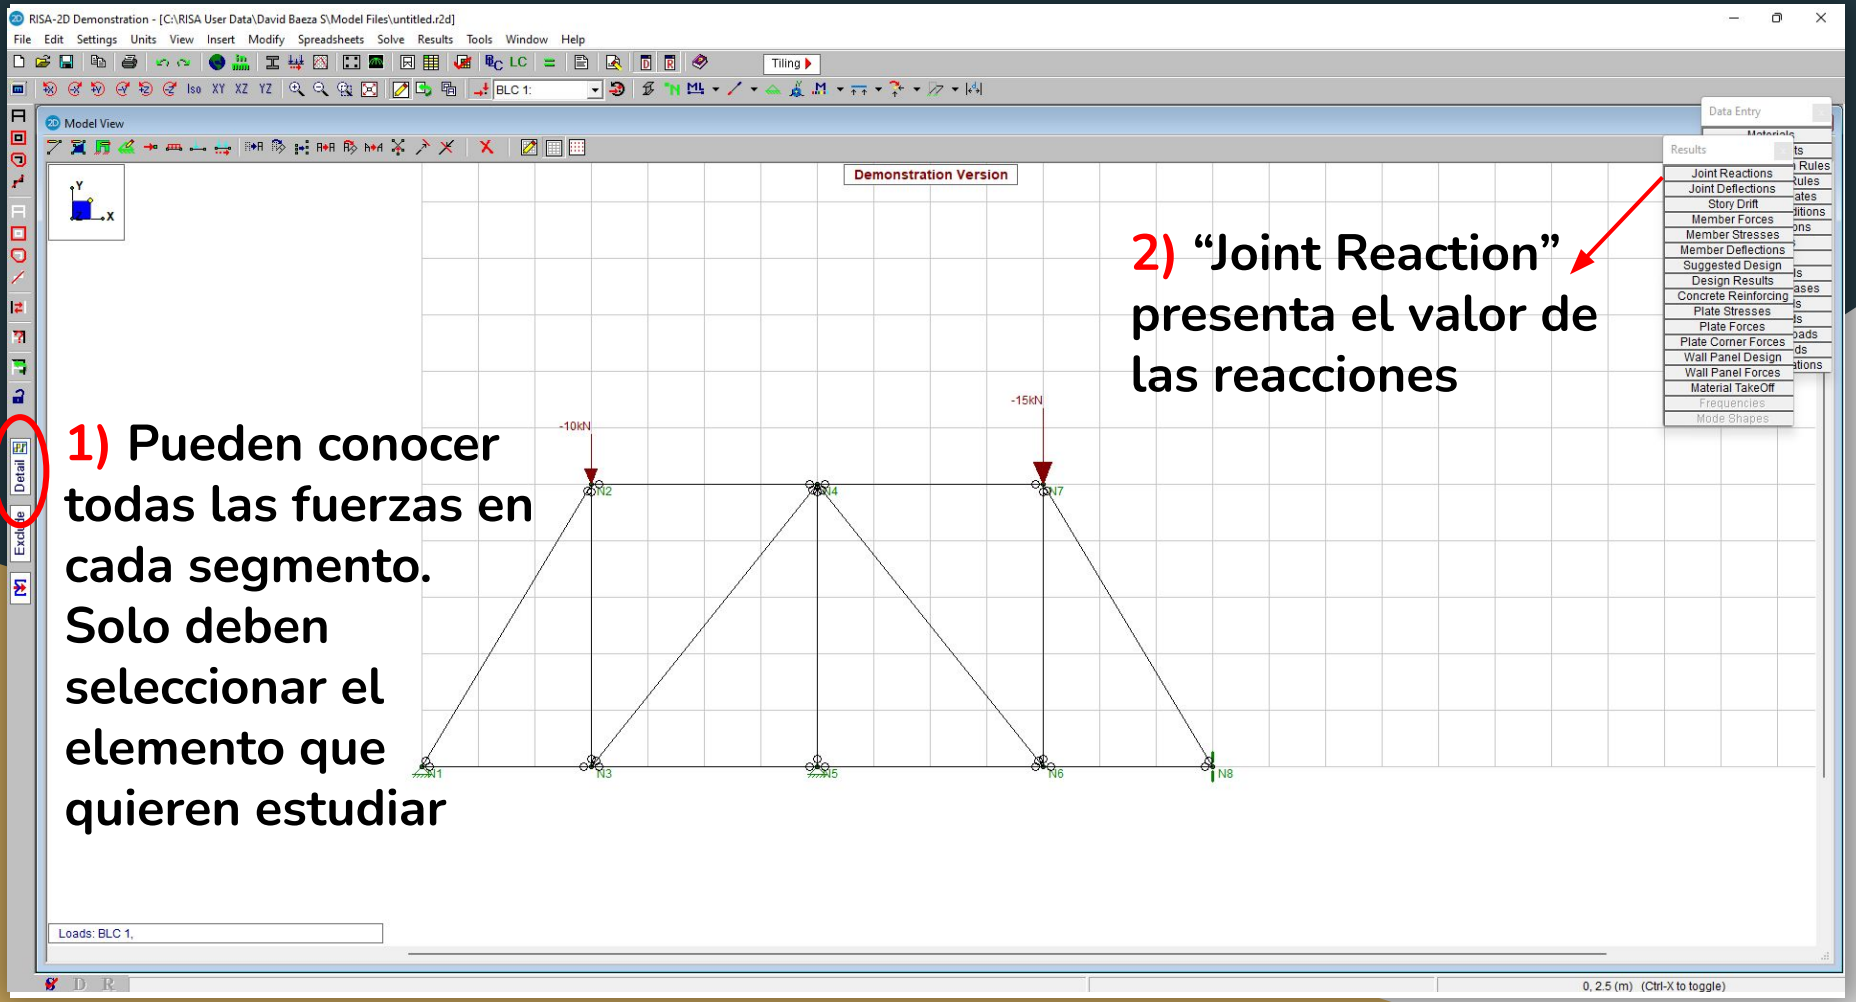
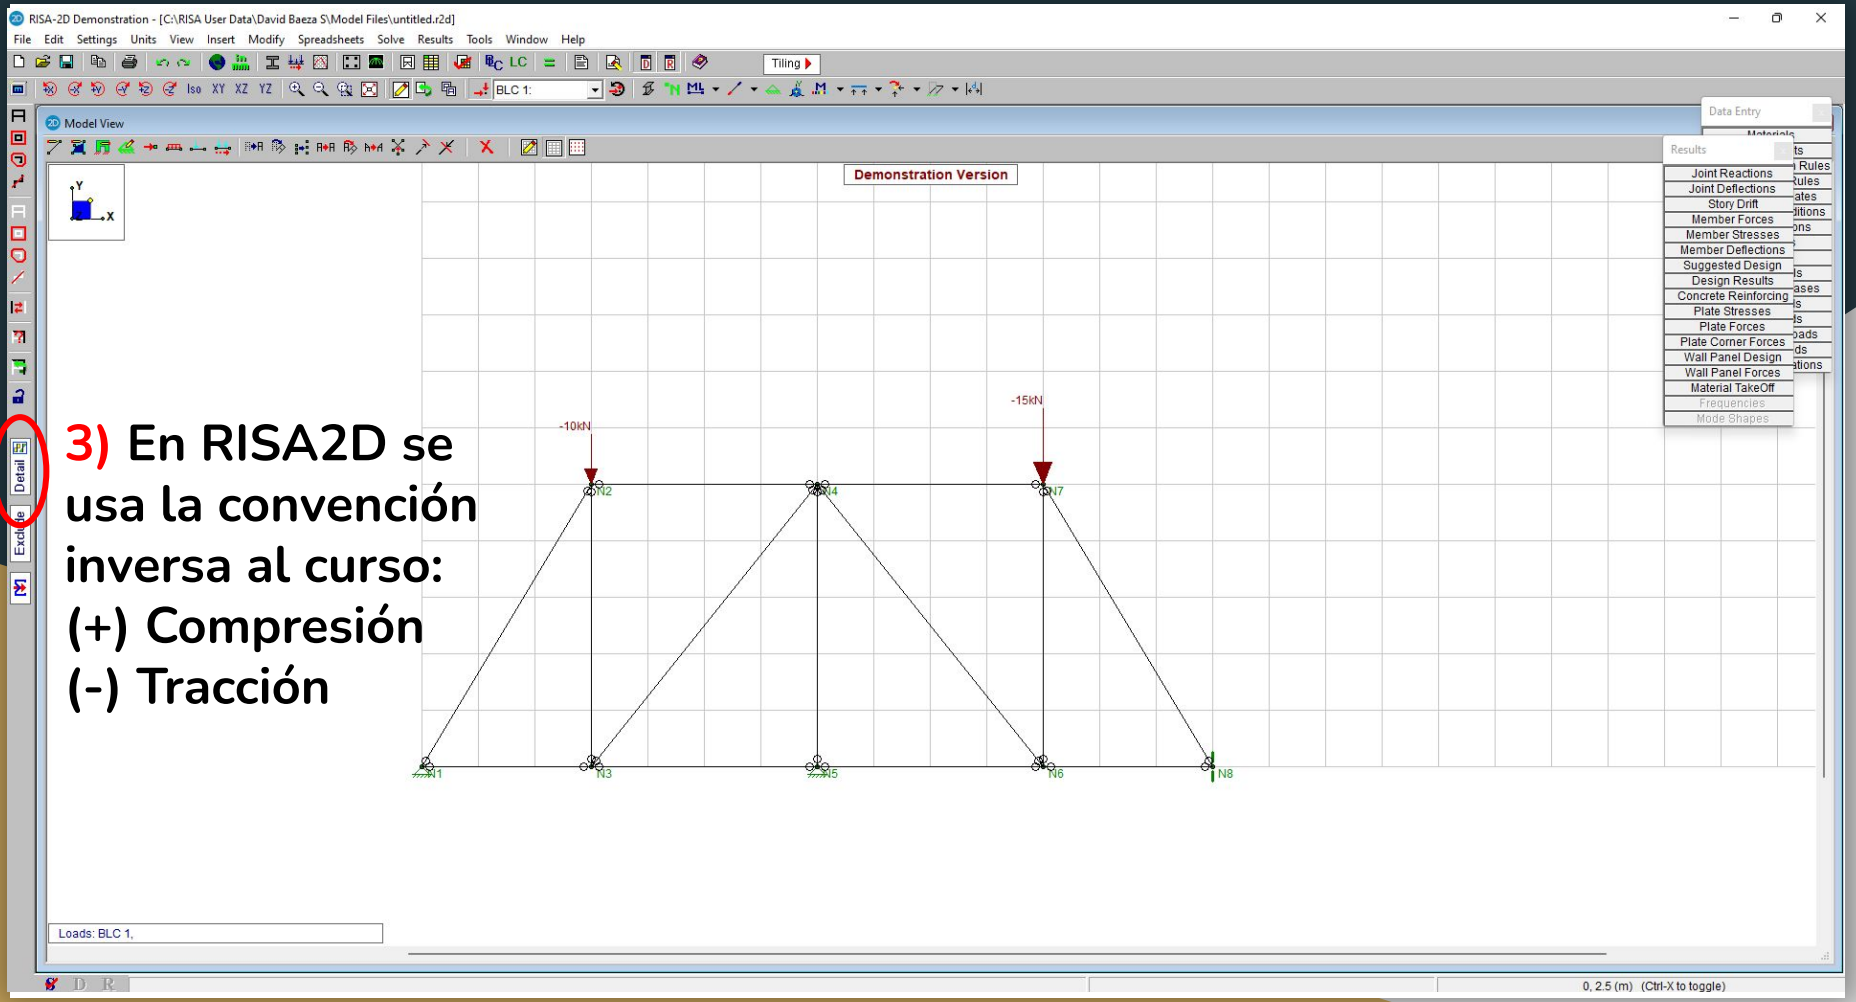
Loads: BLC 1,
4, 2 (m) (Ctrl-X to toggle)



1) Pueden conocer todas las fuerzas en cada segmento. Solo deben seleccionar el elemento que quieren estudiar

2) "Joint Reaction" presenta el valor de las reacciones



3) En RISA2D se usa la convención inversa al curso:
(+) Compresión
(-) Tracción
